

AIM:

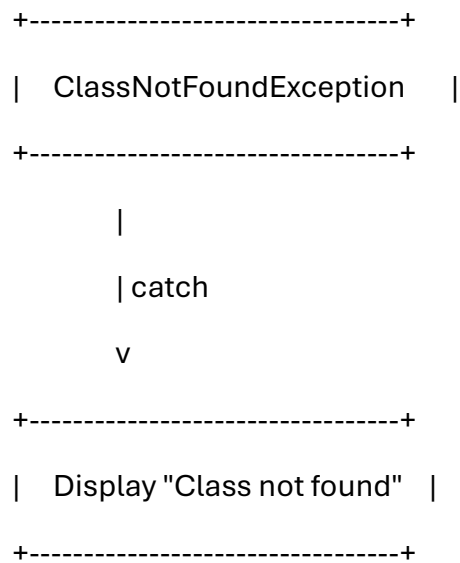

To write, compile, and execute a Java program to demonstrate exception handling using try-catch for handling `ClassNotFoundException` when a specified class cannot be found at runtime.

ALGORITHM

1. **Start** the program.
2. Define a class named `ClassNotFound`.
3. Inside the `main()` method, use a try block.
4. Use `Class.forName("abc.Test")` to load the specified class dynamically.
5. If the class `abc.Test` is not available, Java throws a `ClassNotFoundException`.
6. Transfer control to the catch block.
7. Catch the exception using `ClassNotFoundException`.
8. Display the message "**Class not found**".
9. **Stop** the program.

UML Diagram

Code:

```

package Observations;

public class ClassNotFound{

    public static void main(String[] args) {

        try{

            Class.forName("abc.Test");

        } catch (ClassNotFoundException e) {

            System.out.println("Class not found");

        }

    }

}

```

Output:

```

Observations.ClassNotFound'
Class not found
PS C:\Users\Sahithi\pyla\Desktop\Sahithi_

```

Result:

Thus, the Java program demonstrating exception handling for `ClassNotFoundException` was successfully implemented, compiled, and executed. The exception was

successfully caught and the message "Class not found" was displayed without abnormal termination of the program.
